DEVX – WEEKLY FLASH REPORT - AECC

12/10 – 16/10 Week

DEVX | Usage

Monday	**(!)**	Service incident: CI restart reused an outdated cache and impacted the service; service restored.
Tuesday	**(!)**	Single-user case: server startup blocked because cluster nodes reached the maximum attachable volume count.
Wednesday	**(+)**	Service available – normal operation
Thursday	**(+)**	Service available – normal operation
Friday	**(+)**	Service available – normal operation

Highlight

This week, one service incident and one isolated infrastructure case were reported: a CI restart reused an outdated cache and impacted the service (resolved), while one DevX server startup was blocked by cluster volume attachment limits. AI4Dev daily token capacity per model was increased from 20M to 100M tokens, providing additional usage capacity. In parallel, DevX NextGen capacity planning continued, with 2026/2027 user forecasts being collected and inactive-user cleanup supporting available capacity. New onboarding toward NextGen remains progressive and capacity-dependent.

DEVX – WEEKLY FLASH REPORT - AECC

Global Overview

Progress observed

Service recovery	Service restored after the 12/10 incident linked to a CI restart reusing an outdated cache.
AI4Dev token capacity	Daily token allowance per model increased from 20M to 100M tokens, providing additional usage capacity.
NextGen infrastructure preparation	Additional infrastructure is being prepared to support progressive DevX NextGen adoption.
2026 / 2027 capacity forecast	Expected user volumes are being collected to anticipate infrastructure sizing needs.
Inactive-user cleanup	Inactive accounts are being cleaned up to free capacity before broader onboarding.
Progressive NextGen onboarding	New requests may progressively be oriented to NextGen depending on available capacity.

To Improve

Volume attachment capacity	One reported server-startup case was blocked because all cluster nodes had reached the maximum attachable volume count.
Incident communication	Users asked for clearer centralized communication on service interruptions, resolution and restoration.
Studio vs NextGen onboarding	Guidance is still needed on whether new users should be onboarded to Studio or directly to NextGen.
NextGen infrastructure capacity	Wider adoption depends on infrastructure capacity and the sizing work currently in progress.
Capacity monitoring	Continue tracking inactive accounts and upcoming demand to preserve available capacity.

DEVX – WEEKLY FLASH REPORT - AECC

Main pain points

DEVX	Title	Description	Reported	Owner	Status	Trend
✕	CI / cache incident	A CI restart reused an outdated cache and impacted the service; service was restored.	12/10/2026	DevX team	Resolved	↑
✕	Volume attachment capacity	Single-user/server case: startup blocked because 18/18 nodes exceeded the maximum attachable volume count.	13/10/2026	Infra / DevX	Investigating	–
✕	Incident communication	Participants requested clearer centralized updates for incident start, resolution and service restoration.	13/10/2026	DevX team	To improve	–
✕	NextGen capacity planning	New infrastructure is being prepared and 2026/2027 demand forecasts are being collected for sizing.	13/10/2026	DevX team	In progress	↑
✕	Studio vs NextGen onboarding	Need clearer guidance on whether new users should join Studio or NextGen; decision depends on capacity.	13/10/2026	DevX team	To clarify	–
✕	Inactive-user cleanup	Inactive accounts are being cleaned up to release capacity before broader onboarding.	13/10/2026	DevX team	In progress	↑
